Multiplication: $S = x \cdot y$
Independent Semantics
GRA
Normalized data utility
$\partial S/\partial x = y$
$\partial S/\partial y = x$
Strong semantic coupling:
the effect of one metric
depends on the other.
$\partial S/\partial x = 1$
$\partial S/\partial y = 1$
Ideal independent semantics:
each metric contributes
in a stable and separable way.
Reference-oriented semantics:
not direct multiplication,
but closeness-to-ideal comparison.
